Quick Conversion

As of May 1993, Corbin Russwin has introduced a new simplified product numbering system that makes it easy to identify, specify and order a complete line of architectural hardware.

Although the catalog numbers have changed, the part numbers have remained the same. Identifying parts is as easy as it's always been! If you only know the old catalog number, simply use this "Quick Conversion" as a helpful cross reference bridge from the former Corbin and Russwin languages (pre-May 1993) to the current Corbin Russwin language.

Do You Have the Current Model?

The CK4200 Series cylindrical lockset was introduced in 1952. Since that time, the internal design has undergone three stages of improvements: Model 64, Model 68 and Model 76 (current) were introduced in those years. The exploded views and parts lists in this book apply to Model 76. However, many

parts are the same as those used in earlier models.

The cylinders underwent a major change for the introduction of Model 64. All cylinders for the original model had variously shaped actuators pinned to the plug. Model 64 was the first model to use the current 2000-052 cylinder.

Unfortunately, those old cylinders have been discontinued for several years. Appendix A contains a pictorial reference for the old style cylinders, as replacements are still needed and some distributors still have old inventory available.

Current Assembly

No cap standard.
Black Delrin
cap optional.

Old Style Assembly

CK4210 - Passage or Closet

Routine Maintenance

Periodic adjustment and maintenance will substantially lengthen the life of the lockset and ensure the best possible trouble-free operation.

Time frames in the following maintenance items are based on normal frequency of operation. For high traffic or high abuse applications, perform suggested maintenance more frequently.

If you have questions regarding installation or adjustment, contact an authorized Corbin Russwin distributor or local sales representative.

LUBRICATE CYLINDER

Lubricate (conventional) cylinder with *small* amount of powdered graphite or molybdenum disulfide every six months. Petroleum based liquid spray lubricants such as WD-40™ and LPS-1™ should only be used in cylinders in harsh or corrosive environments and should never be mixed with the aforementioned dry lubricants. For high security cylinder, use Poxylube™ spray.

LUBRICATE MOVING PARTS

Lubricate moving parts of inside and outside chassis with a small amount of grease or other petroleum lubricant every two years.

TIGHTEN THIMBLE

Check lockset for secure fastening to door once a year. Use spanner wrench on inside thimble to tighten as needed.

CARE FOR LOCKSET FINISH

Clean lockset using only a soft, damp cloth. Using lacquer thinners, caustic soaps, abrasive cleaners or polishes could damage the coating, resulting in tarnishing.

Tools

	DESCRIPTION	PART NO.
	Waldes Tru-Arc Pliers for removing and installing large shank retaining ring to gain access to cylinder of knob locksets	CT-25
	Spanner Wrench	300F68-8
	Knob Release Tool	391F65-8

Troubleshooting Guide

PROBLEM	SOLUTIONS
<p>1. Latchbolt does not engage or binds in strike.</p>  <p>(Incorrect Positioning)</p>  <p>(Correct Positioning)</p>  <p>MAIN LATCH DEADLATCH</p>	<p>A. Make sure door and frame are plumb and door is not binding in frame.</p>  <p>B. Are hinges tight? Fill holes if necessary, or rehang door if screws will not hold.</p>  <p>C. Is door warped? Shimming, repositioning or filing strike will often compensate for this condition.</p>  <p>D. Is door or frame sagging? If door and frame cannot be returned to plumb relationship, planing or shaving door and repositioning or shimming strike may help. Shimming hinge(s) may also help.</p> <p>E. Replace, reposition or adjust weatherstripping or door silencers, if necessary.</p> <p>F. If deadlatch is present, be sure it does NOT enter hole in strike when door closes. If necessary, reposition strike or adjust weatherstripping or door silencers. Only main latch should enter strike.</p>
<p>2. Key operates with difficulty.</p>	<p>A. Is latch binding due to door sag or misalignment of latch and strike? (See 1A thru 1F.)</p> <p>B. Lubricate keyway. Do not use petroleum products. Apply powdered graphite to key and move slowly in and out. For high security cylinders, spray Poxylube™ into keyway and move key in and out.</p>  <p>C. Key may be cut out of tolerance. Use calipers or micrometer to check key against published factory specifications. Replace key if necessary.</p> <p>D. Cylinder may be improperly combined. Dismantle cylinder (locksmith only!), measure all pins and compare to published factory specifications. Recombine if necessary.</p>

Removing Cylinder for Rekeying or Other Service

1. Using spanner wrench 300F68-8, unscrew thimble at base of *inside* knob as far as possible and back rose and liner away from door surface, allowing limited access to lock chassis.
2. Using small screwdriver or other probe, push spring-loaded knob retainer toward hinge edge of door. While retainer is pushed, pull inside knob off. Note: to illustrate knob retainer clearly, Figure 1 depicts a larger opening than is normally available.

Figure 1
Access to Inside Knob Retainer

3. Finish unscrewing thimble, remove rose and pull lockset out of door from outside.

Figure 2a
Inside Trim, Model 76

Figure 2b
Inside Trim, Earlier Models

Removing Cylinder for Rekeying or Other Service

4. Outside knob removal differs among models (see Figure 2a and 2b) and functions.

For Model 76 locksets EXCEPT double cylinder functions, remove outside knob same as inside knob; depress retainer under rose and pull knob off.

Figure 3a
Outside Trim, Model 76

For double cylinder functions and for older model locksets, two large screws are visible on inside face of chassis. Remove one screw completely and loosen other screw slightly. Pivot outside knob retainer on remaining screw to disengage from outside knob shank. Remove outside knob.

Figure 4a

Figure 4b

5. To gain access to cylinder, observe base of knob shank as it enters knob. Model 76 locksets have direct access to large Waldes Tru-arc retainer inside knob. If optional black Delrin insert is installed, tap knob shank against hard surface to jar insert loose. Remove to access retainer.

Older models have metal cap pressed onto back of knob and may be held tight, or even sealed in place with paint or varnish. If rapping end of shank against hard surface does not loosen cap, use thin screwdriver or other blade to pry cap away from back of knob and remove.

Figure 5

Removing Cylinder for Rekeying or Other Service

6. Using CT-25 pliers, remove large retainer. Remove knob shank to access cylinder.
7. If replacing cylinder, reverse above steps to reassemble.
If rekeying existing cylinder, refer to *Corbin Russwin Cylinder Manual* for directions, including proper key cutting and pin length specifications.

Figure 6

Caution: When reinstalling lockset, be sure outside thimble and rose are screwed onto chassis tube far enough for proper door thickness.

Also be sure chassis engages latch properly, as shown. Improper engagement will cause lockset to malfunction, resulting in damage and possible lock-ins or lock-outs.

Figure 7

Appendix A

Replacing Old Style Cylinders

460A Type Cylinders

While the old style key-in-knob cylinders have been discontinued, there is a standard replacement for the one cylinder which was the most popular, the 460A type. Most locksets require no modification. However, some do require cutting about 1/4" of the shaft which penetrates the hole in the center of the back of the actuator.

The factory no longer has samples of the locks which used the old style cylinder, so we cannot tell you which locks require alteration and which do not. If you have a retrofit job, you will have to test one lock of each function and knob design to determine what alteration, if any, is required.

The illustration below shows what is needed to retrofit locks with this cylinder. The master ring version is illustrated, but the procedure applies to high security and standard cylinders as well.

If you are applying the above solution with a standard 2000-052 cylinder (identifiable by the stainless steel spring cover) be aware that the cylinder shell interferes in the front of some old knobs. This problem is easy to test for. Install the new style cylinder. Install the knob shank and retainer. If the shank does not go far enough into the knob to install the retainer, then you have the interference problem.

There are three different solutions, listed here in the order of preference:

1. Use master ring cylinders instead of conventional cylinders.
2. File or machine the diameter of the front of the shell around the plug head to .670"
3. File or machine about .015" off the back of the cylinder bible.

This solution, however, does not allow the cylinder to rest in a position as stable as the other two solutions provide.

Solution #2

Other 460 Type Cylinders

The factory no longer has tooling for the variety of old pinned-on actuators, so entire cylinders are obsolete. However, if the order quantity is large enough, it may be possible to furnish the cylinder without the actuator. In this case, the actuator from the old cylinder must be transferred to the new cylinder in the field.

It is easy to transfer actuators for 460B, C, D, E, F, G and M type cylinders because there is a separate plug retainer. Otherwise end play of the plug would be a problem in field conversion. In the A type cylinder described above, it would be difficult to transfer actuators in the field because the actuator also serves as the plug retainer and controls end play. Luckily, we are able to provide a different solution for 460A.

You may also try a modern cylinder with 168F81-8 for 460B and 168F92-8 for 460M type cylinders.
